Implementation Readiness Workspace

Requirements, testing and a useful handoff

A service request can look finished while ownership, acceptance and support are still unclear. I built this fictional Jira and Confluence workspace to make those decisions visible, from intake through validation and closeout.

The important choice was to keep Validation separate from Done. Failed tests stayed in the record so a reviewer could see the original problem, the correction and the retest.

Individual fictional work sample. This is not a customer implementation, production deployment or measured business outcome. The completed core and planned extensions are separate.

Completed core	Recorded result
Requirements and acceptance	10 requirement Stories marked Done
User acceptance testing	10 final passing results, including 2 after correction and retest
Issue inventory	38 total: 35 Done and 3 planned v1.1 items To Do
Handoff	Readiness, rollback, risk and support records documented

How to read this guide

Start with the decisions on page 2. Pages 3-5 show the requirement mappings, preserved failures and readiness evidence. Page 6 explains the limits and planned work. Page 7 identifies the source records and reading routes.

Editorial edition: November 2, 2026. Source review and applied editorial verification: November 1, 2026 (recorded November 2 UTC). Recorded core closeout and final test cycle: September 3, 2026. This companion summarizes retrieved records; it does not claim a new test execution.

Source: S01, S03, S05-S07, S12; complete IRW Jira inventory at the recorded review cutoff.

The decisions behind the workspace

Make the request actionable

The fictional request, SR-001, needed enough information to be evaluated and assigned. The intake record identifies the request type, summary, requester role, impact, timing, supporting details and owner. Missing information stays visible instead of becoming an implied approval.

Keep status meaning clear

The configured states are To Do, Ready, In Progress, Blocked, Validation and Done. They are available states, not a requirement to pass through every one in sequence. Blocked is used when a concrete condition prevents progress. Ordinary unfinished work is not automatically blocked.

Preserve the dependency after it is satisfied

Record	Role in SR-001
IRW-76	Intake record and required-input checks; prerequisite
IRW-75	Triage, priority rationale and ownership; dependent work
IRW-77	Workflow and dependency handling
IRW-78	Acceptance and traceability records

IRW-76 blocks IRW-75. Both items are Done. The retained relationship records the completed dependency; it is not evidence of an active blocker.

Let the evidence produce an unfavorable answer

UAT-007 passed by showing that the readiness rules returned BLOCKED when required closeout conditions were incomplete. The later READY decision was a separate assessment after those conditions were satisfied. A passing test does not mean every state observed during the project was favorable.

Make the next person's work easier

Requirements, implementation items, test results, defects, corrections and the handoff point back to one another. A reviewer should be able to follow a decision without reconstructing it from assumptions.

Source: S03-S06, S09; IRW-28, IRW-72 and IRW-75 through IRW-78.

Requirements connected to final tests

The Version 1.0 baseline contains ten requirements. Each maps to one designated Jira Story and a UAT case. The table below is a compact transcription of the reviewed mappings and final recorded results, not a new test report.

Requirement	Subject	Jira Story	Test	Final result
REQ-001	Service request intake	IRW-17	UAT-001	Pass
REQ-002	Triage and ownership	IRW-18	UAT-002	Pass
REQ-003	Workflow state and visibility	IRW-25	UAT-003	Pass
REQ-004	Dependencies and blockers	IRW-26	UAT-004	Pass after retest
REQ-005	Acceptance criteria and validation	IRW-27	UAT-005	Pass
REQ-006	UAT and defect traceability	IRW-35	UAT-006	Pass after retest
REQ-007	Release readiness decision	IRW-36	UAT-007	Pass
REQ-008	Rollback and smoke checks	IRW-37	UAT-008	Pass
REQ-009	Support transition	IRW-43	UAT-009	Pass
REQ-010	End-to-end traceability	IRW-19	UAT-010	Pass

What the acceptance criteria actually check

REQ-001: A unique identifier and sufficient intake information exist; missing required information is visible before the request is treated as ready.

REQ-004: Dependencies and concrete blockers are distinguishable from ordinary incomplete work. An unresolved release-blocking condition prevents readiness.

REQ-006: The UAT case, Bug, correction and retest remain connected. A corrected Bug needs a recorded retest; an unresolved release-blocking Bug prevents readiness.

REQ-009: Ownership, escalation, diagnostic guidance, limitations and the required handoff material are available before transition is considered complete.

REQ-008 is Medium priority; the other nine requirements are High. Those priorities describe this fictional project, not an employer's operating environment.

Source: S03, S05, S06; ten requirement Stories and their labels, priorities, statuses and resolutions at the recorded cutoff.

Two failures worth keeping in the record

UAT-004 / IRW-82: a stale dependency interpretation

Observed problem: A later test record used a stale interpretation of the SR-001 dependency and mixed setup and defect references. The narrative did not agree with the actual Jira relationship.

Correction: Align the descriptions and test references to IRW-76 blocking IRW-75, preserve the failed interpretation, and check the relationship from both issue views.

Recorded result: UAT-004 passed on retest. IRW-82 is Done. UAT-010 also passed using the corrected traceability path.

This was a dependency-record and test-mapping correction. It should not be presented as a production software defect or a customer incident.

UAT-006 / IRW-87: a deliberately incomplete fixture

Initial fixture: NEG-001 intentionally omitted the Source UAT Test ID. The inspection could not identify the originating test without outside context, so UAT-006 failed. The Bug was created after that observation.

Correction: Add UAT-006, IRW-87, the requirement and Story references, severity, correction details and retest references. Keep the initial missing-field record visible.

Retest: Repeat the same field-by-field inspection. The corrected record exposes the full chain without inference:

REQ-006 > IRW-35 > UAT-006 > initial FAIL > IRW-87 > correction > retest PASS

Recorded result: UAT-006 passed after correction. IRW-87 is Done. No active release-blocking condition remains in the recorded core scope.

The lesson is not that the exercise never failed. It is that the work remains understandable after a failure, including what changed and why the final result can be trusted.

Source: S05-S08; reviewed IRW-82 and IRW-87 descriptions. Earlier detailed comments and every page-history version were not re-audited for this companion.

What supported the readiness decision

The recorded decision is IRW-CORE-V1.0: READY, dated September 3, 2026, with Tyler Windes as decision owner. It is a decision for the fictional exercise, not production release approval or customer acceptance.

Condition	Recorded evidence
Requirement completion	All ten requirement Stories are Done.
Acceptance testing	All ten cases have final passing results; two initial failures remain visible.
Defects and blockers	Both Bugs are Done after correction and retest; no core work remains Blocked.
Implementation dependency	IRW-76 blocks IRW-75; both are Done.
Recovery planning	Rollback triggers, recovery-point selection, correction/restoration and post-change checks are documented.
Support handoff	Owner, escalation, routine checks, diagnostic guidance and limitations are documented.
Scope separation	IRW-73, IRW-85 and IRW-86 remain planned v1.1 work, outside core completion.

A usable handoff, not just a completion label

The runbook tells a maintainer to read the affected source record, compare it with the requirements and test evidence, make the smallest justified correction, and check the result. A summary or timestamp does not override contradictory project records.

Recovery planning has a narrow meaning here

Rollback means restoring or correcting the accepted Jira and Confluence state after an unintended change. UAT-008 evaluated the documented plan. It did not demonstrate a production infrastructure rollback or customer-data recovery.

The formal model also includes NOT ASSESSED when available information is too incomplete or unreliable for a defensible decision. That guard should remain distinct from a confirmed blocker.

Source: S09-S12; IRW-80, IRW-81, IRW-83, IRW-88 and IRW-90.

Scope, limitations and planned extensions

Two layers, one project family

Platform-neutral foundation	Atlassian implementation
Eight separate synthetic validation cases in the public foundation repository.	Ten IRW requirements and ten UAT cases in Jira and Confluence.
A modeled implementation-readiness and handoff lifecycle.	A fictional service-request workspace with issue state, dependencies, tests and project records.
Foundation results are not the IRW test register.	IRW results do not imply customer delivery or independent user acceptance.

Planned does not mean implemented

Item	Current boundary
IRW-73	Jira saved filters and a readiness dashboard: design complete; implementation remains To Do.
IRW-85	Read-only Forge readiness component: design complete; source/app identity, build, deployment, installation and runtime validation are not established.
IRW-86	Roadmap Epic for those extensions; To Do, not a blocker to completed core v1.0.

Learning update: Tyler earned the Atlassian Credentialed in Forge Fundamentals certificate on September 21, 2026. The provider evidence is recorded in CRED-0031. That certificate does not establish a working Forge application. The November 1 editorial corrections were applied and read back; the dated September 3 closeout history remains intact.

Limits that remain visible

This is an individual project. Tyler filled the analyst, implementer, tester, decision-owner and support-owner roles. The source case study discloses automation assistance while retaining responsibility for decisions and review. The project does not establish an independent QA team, customer outcomes, enterprise scale, production administration, a support SLA, a completed dashboard or a running Forge component.

The four existing public reader pages rendered without sign-in during the recorded source verification. Other supporting records may require access. No access settings were changed. HTML remains the primary mobile/accessibility reading route; PDF tagging and PDF/UA conformance have not been verified.

Source: S01, S10-S14; IRW-73, IRW-84, IRW-85 and IRW-86; Portfolio credential evidence CRED-0031. No new core test execution.

Sources and how to explore the work

This is an editorial companion assembled from retrieved Jira and Confluence records. It is not a screenshot, native Confluence export or new UAT execution. Essential selected evidence is included here; reading the PDF does not require an Atlassian account.

Version cutoff: November 1 editorial application and readback, recorded November 2 UTC. The live Project Plan snapshot d1:70 is distinct from its older published representation. Versions not changed in that editorial pass retain their earlier source-review pins. This edition does not claim a fresh audit of every source or history.

Additional reviewed records: 38 Jira descriptions and selected fields; archive index 852095/version 2; public portfolio base d257d5a; native credential evidence register. Earlier archived bodies and every Jira comment were not exhaustively reviewed.

This November 2, 2026 edition incorporates the applied editorial corrections while preserving the November 1 source-review cutoff and September 3 core-test history. Public reader access is separate from authenticated workspace access; planned work is separate from implementation.
